

Recombinant ELISA for the diagnosis of Leptospirosis

Salient features of the technology:

- Recombinant ELISA based diagnostic kit for leptospirosis. Kits have been developed and evaluated using recombinant protein and have found acceptable levels of indices of validity.
- Good specificity and sensitivity.
- Inexpensive when compared with commercially available techniques.
- In-house production in the laboratory for internal use and supply to limited number of laboratories. Commercial level production not yet initiated.
- Product is ready.
- This technology has been developed by RMRC, Port Blair (an ICMR institute).
